| Slot: 8 | Category: Structured Enquiry | Title:PHP | Batch :B1 | Marks:20 |

Build an address book.

Address Books let you refer to lists of your mobile or cell phone numbers by name. Once you have filled the Address Book with numbers you can quickly send the same message to everyone in the Address Book. This can be much quicker and more accurate than re-entering a list of numbers each time you want to send a message to a group.

Write a PHP file which consists of form having the following fields.

- Cell phone number
- The person's given name
- A custom message

Button to add to a group, (like friends, colleagues, Home)

Send button which sends customized message to selected group of people (Use combo box for selecting group)

Save appropriate data by creating necessary tables in database

Item	Description	Maximum length
Mobile or cell phone number	The telephone number of the recipient	16
Group	An arbitrary group name that you will find useful	20
Given name	The first or given name of the person	20
Message	You can merge entries from your Address Book into your message by putting placeholders anywhere in your message.	40

Also provide the following functionalities:

- Retrieve the number of people in a group
- Display the recent 5 messages sent to a group.
- Display the numbers which are common in two groups
